DICHTOMATIK O-RING HANDBOOK 132

ELASTOMER BASICS Before selecting an elastomer, it is important to have a basic understanding of what an elastomer is and what makes it unique as a class of materials. To understand elastomers, one has to first have a basic understanding of polymers. Polymers are long chains of repeating chemical units, or monomers.

Multiple AS568-214 o-rings of a low VF2 content fluorocarbon were aged in a time sequence up to 12,000-hours of 150C continuous steam. The saturated steam / hot water was a controlled pH of 7.0-7.5 that would simulate a factory steam loop. Usually, a slightly basic pH is maintained to prevent corrosion in all such steam systems.

A fluid penetrates the elastomer and saturates it, at high pressure (typically greater than >750 psi); and, during rapid depressurization of the system, causes damage to the o-ring. During depressurisation, the “dissolved” gas rapidly expands, and if it cannot rapidly diffuse out of the elastomer, it may cause blisters (mild attack), cracks, splits or blow apart the ring.
