High Resolution X Ray Diffractometry

The main aim of the book is to map the theoretical and practical background necessary to the study of single crystal materials by means of high-resolution x-ray diffraction and topography. It combines mathematical formalisms with graphical explanations and hands-on practical advice for interpreting data.

High resolution x-ray diffractometry High resolution x-ray diffraction (HRXRD) is an ex-situ characterization method and it is the core tool to analyze nano-scale epitaxial structures. X-rays are produced from a source where electrons are ejected from a cathode, collide on a metal plate (in our case copper) and excite inner-shell electrons in the metal, resulting in the emission of strong ...

High-resolution X-ray diffraction (HRXRD) is a collection of application techniques for the non-destructive analysis of mostly layered, nearly-perfect crystalline structured materials. The structural parameters that can be revealed and quantified are essential for the successful application of such materials.

Neutron-induced damage in SiC up to a fluence of 1.9×10^{27} n/m² ($E > 0.1$ MeV) was examined by means of X-ray diffractometry and high-resolution electron microscopy. Specimens of β -SiC were irradiated in fast breeder reactors at 370 to 650°C. The lattice parameters of all specimens were increased by the irradiation, but above 2×10^{26} n/m² lattice expansion decreased and was accompanied by ...

Introduction High resolution X-ray diffractometry and topography are now widely accepted techniques for the study of small strains in highly perfect crystals. They differ in that diffractometry examines, as a function of angle, the variation of the total scattered intensity from the area of sample illuminated by the X-ray beam (which may itself be conditioned by one or more Bragg reflection ...
