and plays an important role in breeding programs and developmental studies.

The most commonly used methods of haploid induction, leading to haploid plants in vitro through the plant tissue/cell culture, are named as the in vitro -based (IVB) methods.

Abstract. Spelt (*Triticum aestivum* ssp. *spelta*), a close relative of wheat, was the main cereal in central Europe until the beginning of this century. Its supposed origin is the Middle East or Europe. Although today wheat has mostly replaced spelt, a small growing area has remained in Central Europe, for

unexplored. In this study, both CenH3 RNAi and in vitro inhibition were used to simulate and induce haploids in allopolyploid crop. Notably, in vitro CenH3 inhibition showed that the results were much the same to that of RNAi in phenotype, chromosome behavior, microspore production, and haploid induction.

Haploid embryos are produced in vivo by parthenogenesis, pseudogamy, or chromosome elimination after wide crossing. The haploid embryo is rescued, cultured, and chromosome-doubling produces doubled haploids. The in vitro methods include gynogenesis (ovary and flower culture) and androgenesis (anther
