Mercury Small Engine Manual Choke
An engine that requires the choking (partial or full) after initial engine warm up is an indication that the engine fuel air mixture system is out of adjustment. Leaving the choke on while operating will result in excessive fuel consumption, irregular engine power performance and eventually may even damage the engine.

Engine Only Runs with Choke On or Pressing Primer
Its purpose is to restrict the flow of air, thereby enriching the fuel-air mixture while starting the engine. Depending on engine design and application, the valve can be activated manually by the operator of the engine (via a lever or pull handle) or automatically by a temperature-sensitive mechanism called an autochoke.

The choke is located before the throttle, and manages the total amount of air going into the engine. The choke is only used when starting a cold engine. When doing a cold start, the choke should be closed to limit the amount of air going in. This increases the amount of fuel in the cylinder and helps to keep the engine running, while it is ...

Manual says to "NOT ADVANCE THE IDLE SPEED WHEN STARTING" do not give it any throttle when starting. Just start it in the neutral position. The electronic fuel injection will give it the amount of gas it needs to start. If you give it any gas it will flood. The proceedure for starting a flooded engine is to advance the throttle and choke.
